Overall impression and suggestions about the interview

He is good with technical skills and logic development. He accepts improvisations in the code but he can ask more around requirements given for coding questions. Thinking aloud while solving a coding problem might help the interviewer understanding his thinking process. He can tackle situational with a different point of view. Try not to miss sub questions in a question asked by the interviewer, he can ask the interviewer to repeat the question if he thinks he has missed any question. Improving communication skills will be another add on to his interview. He remained calm even if he was interrupted while he was speaking.
